Online help

GETTING STARTED - GENERAL INFO

Domain name - SSL Certificate (HTTPS)

Install a domain name without associated email (DNS)

GoodBarber provides a Progressive Web App (PWA) available on all screens (Desktop, Tablet, Mobile).

By default, your PWA is accessible from this URL: **http://<appname>.goodbarber.com**.
However, you can (and should) personalize this URL and install a domain.

If you don't already own a domain name, you can buy a one from different registrars, for instance:
https://www.ovh.com/
https://www.gandi.net/
https://www.1and1.com/
https://www.godaddy.com/

You can of course, buy your domain name from any other registrar.

1. Important!

This online helps concerns you if:
- you own a domain name and the domain name is used **only** for your GoodBarber project
- you **don't have** any email addresses attached to this domain (we don't manage emails).

If you use your domain for an other project, or have emails address linked to your domain, follow the instructions given in the online help: Install a domain name with existing emails (CNAME) or you will lose your emails and/or your other project than GoodBarber won't be accessible via your domain any more.

If you're not in the situations above, to install your domain name on your PWA, you can choose to hand over the management of your DNS servers to GoodBarber.
This setup is the easiest solution.

2. Go to the menu Publish > Administration > Domain name
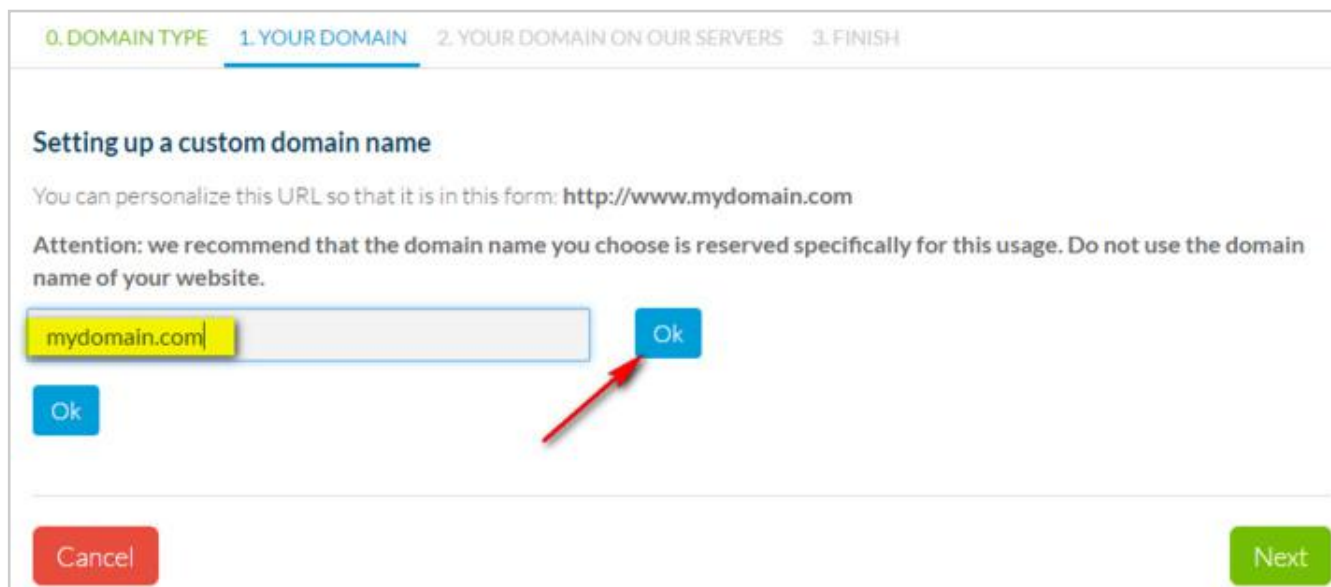

Choose the option titled "**I want to install my domain by delegating the management of the DNS servers to GoodBarber**", then click "**Next**".

3. Indicate your domain name

In the next step, indicate the domain name you would like to install, without specifying www., then click "**OK**".

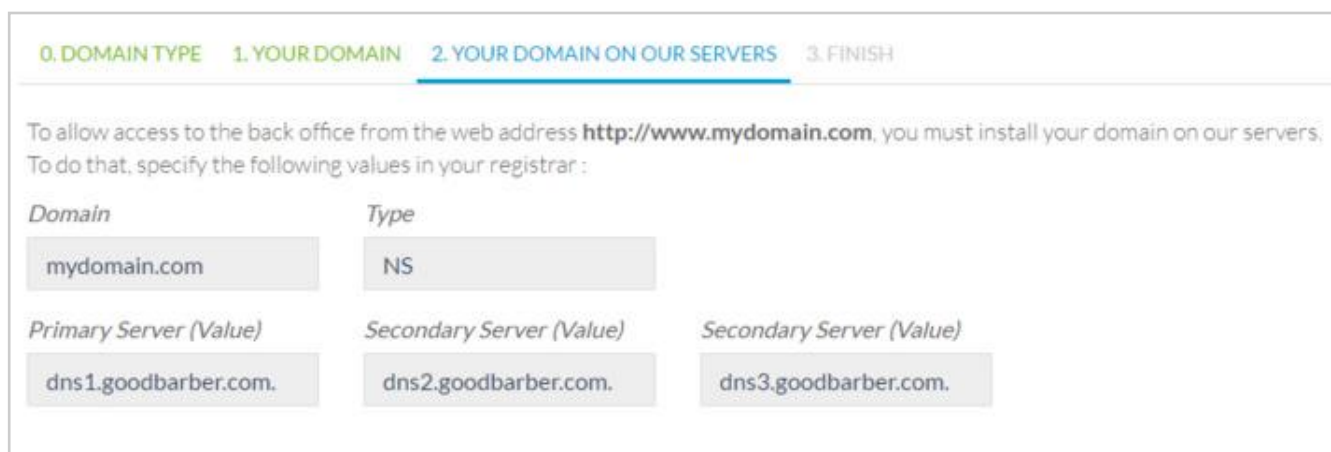

4. Setup step

In the next step, you will get the parameters that you must fill in, in your registrar interface. You cannot access the next step unless you've filled in the parameters on your registrar platform and the propagation has been carried out.

On your registrar interface, you must edit the DNS for the following values:

- **dns1.goodbarber.com**
- **dns2.goodbarber.com**
- **dns3.goodbarber.com**

You might have to wait 24 to 48 hours for the DNS propagation, in order for the modification to be applied to all users.

5. Back to the GoodBarber back office

After the DNS server modifications are propagated, the back office should allow you to access the final step.
In the menu **Publish > Administration > Domain name**, click **Next**.

6. Finalize the installation

If all parameters are correct, you can finalize the installation of your domain name on your PWA by clicking "**Finalize installation**".

7. Installation in progress

For a few minutes, the GoodBarber back office will say that the installation of the domain name is in **progress**.

8. Installation complete

Congratulations, it's done! After successfully installing the domain name on the GoodBarber servers, the back office will indicate that **your PWA is accessible via your domain name**.

> (i) Note: the record has been correctly set on our servers.
> If your browser doesn't display this address, you need to wait for the DNS propagation to reach your terminal (between 3 and 4 hours)

Your domain

Your web app is now accessible from the domain : **https://www.mydomain.com/**

🗑 Delete this domain

Note: Please check below for links to detailed online helps on how to change the DNS on some specific registrars
